S. No. of Question Paper : 2544

Unique Paper Code : 2352571101

Name of the Paper : DSC : Topics in Calculus

Name of the Course : B.A./B.Sc. (Prog.) with Mathematics as Non-Major/Minor

Semester : I

Duration : 3 Hours

Maximum Marks : 90

(Write your Roll No. on the top immediately on receipt of this question paper.)

Attempt *all* questions by selecting *two* parts from each question.

All questions carry equal marks.

1. (a) Test the continuity and differentiability of the function $f(x) = \begin{cases} 1+x & \text{if } x \leq 2 \\ 5-x & \text{if } x \geq 2 \end{cases}$

at $x = 2$.

- (b) Find the n th differential coefficients of $\sin^3 x$.

- (c) State Euler's theorem and verify it for $f(x, y, z) = 3x^2yz + 5xy^2z + 4z^4$.

2. (a) Show that the function $f(x)$ defined by :

$$f(x) = \begin{cases} 0, & \text{for } x = 0 \\ \frac{1}{2} - x, & \text{for } 0 < x < \frac{1}{2} \\ \frac{1}{2}, & \text{for } x = \frac{1}{2} \\ \frac{3}{2} - x, & \text{for } \frac{1}{2} < x < 1 \\ 1, & \text{for } x = 1 \end{cases}$$

has three points of discontinuity. Find such

points and examine the kind of discontinuities.

P.T.O.

(b) If $y = \sin (m \sin^{-1} x)$,

show that $(1 - x^2) y_{n+2} - (2n + 1) x y_{n+1} - (n^2 - m^2) y_n = 0$.

(c) If $u = x^2 \tan^{-1} \frac{y}{x} - y^2 \tan^{-1} \frac{x}{y}$, prove that $\frac{\partial^2 u}{\partial y \partial x} = \frac{x^2 - y^2}{x^2 + y^2}$.

3. (a) State Lagrange's mean value theorem and use it to show that :

$$\frac{x}{1+x} < \log (1+x) < x, \quad \text{for } x > 0.$$

Hence show that $0 < \log (1+x)^{-1} - x^{-1} < 1$, for $x > 0$.

(b) With the help of Maclaurin's theorem give the expansion of $f(x) = \tan x$ in ascending power of x .

(c) Evaluate $\lim_{x \rightarrow 0} \frac{x}{|x|}$.

4. (a) Verify Rolle's theorem for the function $f(x) = (x - a)^2 (x - b)^3$ for all $x \in [a, b]$.

(b) Separate the intervals in which the polynomial $2x^3 - 15x^2 + 36x + 1$ is increasing or decreasing.

(c) Determine the values of a and b for which

$$\lim_{x \rightarrow 0} \frac{x(1 + a \cos x) - b \sin x}{x^3} \text{ exists and equals 1.}$$

5. (a) Find all the asymptotes of the curve :

$$y^3 - x^2 y - 2xy^2 + 2x^3 - 7xy + 3y^2 + 2x^2 + 2x + 2y + 1 = 0.$$

- (b) Find the range of values of x in which the curve :

$$y = 3x^5 - 40x^3 + 3x - 20$$

is concave upwards or downwards. Also find its points of inflexion.

- (c) Find the reduction formula for $\int \cos^n x \, dx$.

Hence, evaluate $\int_0^{\frac{\pi}{2}} \cos^7 x \, dx$.

6. (a) Determine the position and character of the double points on the curve :

$$(x - 2)^2 = y(y - 1)^2.$$

- (b) Trace the curve $y^2(2a - x) = x^3$, $a > 0$.

- (c) Obtain a reduction formula for $\int \sin^m x \cos^n x \, dx$. Hence evaluate $\int_0^{\frac{\pi}{2}} \sin^4 x \cos^3 x \, dx$.
